HAVi Vibration Monitors with Sound Level Meter

Features

- Three or six HAVi Vibration Monitors
- An Integrating Sound Level Meter
- A Sound Level Calibrator
- Strong carry case

Applications

- Hand arm vibration monitoring
- HAVs assessment
- Noise at work survey
- Measure Noise and Vibration Exposure Time

Overview

This Combination Kit includes vibration monitors and an integrating sound level meter to assess for high noise levels in the workplace.

HAVi Vibration Monitors

These small devices mount on a tool and measure the amount of time the worker is exposed to vibration. You enter the vibration magnitude for the tool in use and the HAVi displays the exposure as HSE points.

You can find more information on the HAVi pages.

Sound Level Meter and Calibrator

These kits include a calibrated CR162B Class 2 Integrating Sound Level Meter, which meets all the requirements of the Occupational Noise regulations. Using this meter you can accurately measure the sound levels that a worker is exposed to and check for the risk of hearing damage.

As the regulations demand the use of a Sound Level Calibrator, one is included in this kit.

You can read more about this product on the CR162B Optimus Industrial pages.
